

BattleArena — Games on top of Collector Crypt graded NFTs

Skill-based PvP where Collector Crypt graded cards are the stakes, and every match drives pack sales and buybacks back to Collector Crypt.

We're building a games layer on top of CC's tokenized graded cards. Players use their CC NFTs as the playing piece; a card's `insuredValue` (never listing price — the value can't be manipulated by the player) sets a **capped** advantage, so better cards matter without turning it into pay-to-win. Everything settles trustlessly on Solana, with CC's own data and randomness as the source of truth.

Three games, one funnel

1. **Blotto duel** — hidden-reserve mana allocation across three fronts, played commit-reveal, best-of-3. Pure skill; a card's value only grants a small capped edge.
2. **Pack opener** — open CC packs, then jump straight into a battle with the pulled card.
3. **Pack Battle (the volume driver)** — two players each open a pack of the same tier; **the winner takes both cards**. The creator picks how the winner is decided:
 - o **Direct** — higher `insuredValue` wins. Instant, chance-based.
 - o **Mana Duel** — the two freshly-pulled cards are played out in a Blotto match; card value only feeds the mana edge, **skill decides the winner**.

The pulled card is delivered **straight into the battle's on-chain escrow**, so it never sits in a player's wallet and can't be pulled out before the result.

Why this is good for Collector Crypt

Every **Pack Battle** is, as a direct effect of playing:

- **2 pack sales** to CC (the tier price x2).
- A **buyback opportunity** — winners can sell won cards back to CC (more volume).
- A showcase for **CC's VRF** as the verifiable, tamper-proof arbiter of the game.

Three revenue hooks for CC in a single game mode — wrapped in a trustless, skill-forward product that fits the platform's narrative, not a casino.

What we need from you

A **devnet Gacha API key**, so we can validate the two assumptions the winner-takes-cards design rests on:

1. A pull can be **delivered to a program-owned escrow account** (via `altRecipient` / `altPlayerAddress`), so the prize is held trustlessly.
2. CC gacha NFTs are **freely transferable** (not frozen / no transfer-hooks that would block the escrow).

We'd build on your reference stack (Privy embedded wallets, per the `gacha-starter` demo) and keep the API key strictly server-side. A production key would follow once the loop is validated on devnet.
